Profile

Senior BI Data Analyst with 4+ years' experience delivering business-critical analytics, automation, and data solutions in a complex ERP-driven environment. Trusted technical SME for SQL Server performance, data quality, and enterprise BI platforms. Proven track record of translating executive and operational requirements into reliable data systems with measurable commercial and customer impact.

Core Skills

Analytics and BI

- Advanced T-SQL including Window Functions, Dynamic SQL, and performance tuning.
- Dimensional data modelling using Kimball methodologies.
- Power BI
- Qlik Sense (Developer and Administrator)
- SSRS

Automation and Data Solutions

- ETL and automation using SSIS and Python
- Data quality and master data management
- ERP-integrated data solutions with SAP Rise

Platforms

- Microsoft SQL Server (on-prem)
- Qlik Sense administration (on-prem)
- PostgreSQL on Ubuntu Server (non-production)
- Jira
- Exploration of containerised dbt Core and Dagster (non-production)

Experience

Senior BI Data Analyst - Unipart

2022 to present

I own and deliver most of our high-profile, business-critical reporting across Sales, Margin, Invoiced Sales, OTIF, Backorders, and Quote Conversion. I have re-engineered inherited and legacy reporting solutions, reducing runtimes from over 20 minutes to seconds through advanced SQL optimisation and data model redesign. I act as the primary developer and administrator for an on-prem Qlik Sense platform and am trusted with production credentials and server-level configuration.

I partner with senior stakeholders up to Finance Director and Managing Director level, shaping analytics used for operational and strategic decision-making, and serve as the organisational SME for SQL Server performance tuning, supporting Analysts and Developers across the business. I provide informal mentoring and code reviews for junior Analysts and participate in the IT on-call rota (non-network), supporting the availability of data and reporting platforms.

Projects and Impact

Master Data Management and Data Quality Framework

I designed and implemented a SQL-driven master data management system to identify and track data quality violations across multiple business domains. The solution used dynamic SQL to parameterise key fields, joins, and rule logic, enabling scalable and reusable validation patterns. Violations are persisted as stateful records, allowing ownership, open duration, and resolution status to be tracked by business area, significantly improving data quality governance and accountability.

Backorders and Supply-Demand Visibility (MD sponsored transformation project)

As part of a Managing Director sponsored transformation initiative, I extended Backorders analytics with workflow-enabled reporting using Vizlib Writeback back into database tables. I built set-based T-SQL allocation logic using advanced window functions to link inbound Purchase Orders and Requisitions to outbound Sales Orders, enabling proactive Procurement actions aligned to customer demand. This work contributed to a £500k reduction in Backorders within two months.

Customer and Order Process Automation

I built a SQL-based Order Acknowledgement system producing well-formatted HTML emails, significantly improving customer communication without additional platform costs. The solution was designed to be idempotent, batched, and resilient to restarts or failures, delivering measurable customer experience improvements while eliminating a manual process.

Education

BSc Mathematics (*University of Leeds*)

A*, B, B at A-Level in Mathematics, Further Mathematics, and Statistics
